

Team 404: Project Proposal – Emergency Rescue Ticketing & Dispatch System

During localized crises like severe floods or typhoons, emergency responders often lack centralized, up-to-date data on the locations and immediate needs of vulnerable individuals in the community. Without a clear, organized view of active distress signals, it becomes difficult to prioritize evacuations and dispatch rescue teams efficiently. Users need a simple, dedicated way to register their household's vulnerability status, while local government units need a centralized dashboard to track incident resolutions before a manageable situation turns into a critical emergency.

Objectives

General Objective: To develop a web-based system that helps local government units and rescue teams locate, track, and triage vulnerable individuals during emergency situations.

Specific Objectives:

- Let users or their guardians securely log their household location, specific needs (*ex: PWD status, medical equipment*), and emergency contacts in one dashboard.
- Emphasize real-time status updates, allowing users to manually flag via their browsers if they need immediate rescue, which automatically generates a help ticket in the system.
- Provide institutional oversight features through an interactive dashboard that allows dispatchers to manage and update the status of active rescue tickets (e.g., Pending, Dispatched, Resolved).
- Give dispatchers visual reports that display the real-time amount of emergency tickets categorized by their current status (Pending, Dispatched, and Resolved) to make the overall operational capacity easy to understand at a glance.

Proposed Solution

The Emergency Response & Vulnerability Dashboard is a web application built for local rescue teams and community members to streamline disaster response. Its core functionalities include a secure community registry, an incident ticketing system, and a visual dashboard for dispatchers.

For example, if a severe flood hits a neighborhood, registered users can update their status to "Requires Evacuation." The system instantly generates a priority ticket on the dispatcher's

screen. The dispatcher can then notify a rescue team and manually update the ticket's status from "Pending" to "Dispatched," ensuring no one is overlooked and resources are allocated effectively.

Scope Summary

Category	Details
CRUD on	User Profiles, Vulnerability Statuses, Emergency Tickets
Roles	Resident/Guardian, Dispatcher
