

Team404: Project Proposal – Student Academic Early-Warning System

Problem Statement

Many students struggle academically long before they officially fail, but declining grades, poor attendance, and missed requirements often go unnoticed until it is too late for meaningful action. Students themselves rarely have a simple way to track their own standing across subjects, so they may not realize they are falling behind until the damage is already done.

Objectives

General Objective: To develop a web-based system that helps students identify and act on early signs of academic difficulty before they fail. Specific Objectives:

- Let students track their own grades, attendance, and requirements in one dashboard.
- Detect declining performance trends and missed requirements automatically.
- Notify students when a subject needs attention.
- Give students a checklist-style study plan and let them collaborate with classmates on shared tasks.

Proposed Solution

The Student Academic Early-Warning System is a web application built for students, letting them monitor their own academic performance and catch warning signs early. Its core functionalities include a personal dashboard for grades, attendance, and requirements; automatic detection of declining trends; alerts for at-risk subjects; and a checklist-style study plan that students can follow and share with classmates for collaborative study sessions. For example, if a student scores low on three consecutive programming assessments, the system detects the trend and gives a checklist of learning materials and practice exercises, with an option to invite classmates working on the same subject to study together.

Expected users: students.
